# GLOBAL UNITY MEDITATION FOR PLANETARY HEALING APRIL 4TH/5TH 2020

The meditation begins at 10:45 pm EDT on April 4th in New York, 02:45 UDT on the5th.

We use a period of 2 hours beginning at 02:45 UDT to represent the global meditation and prayer. The first figure displays the result. It shows a steady trend downward, as we often see for meditation.

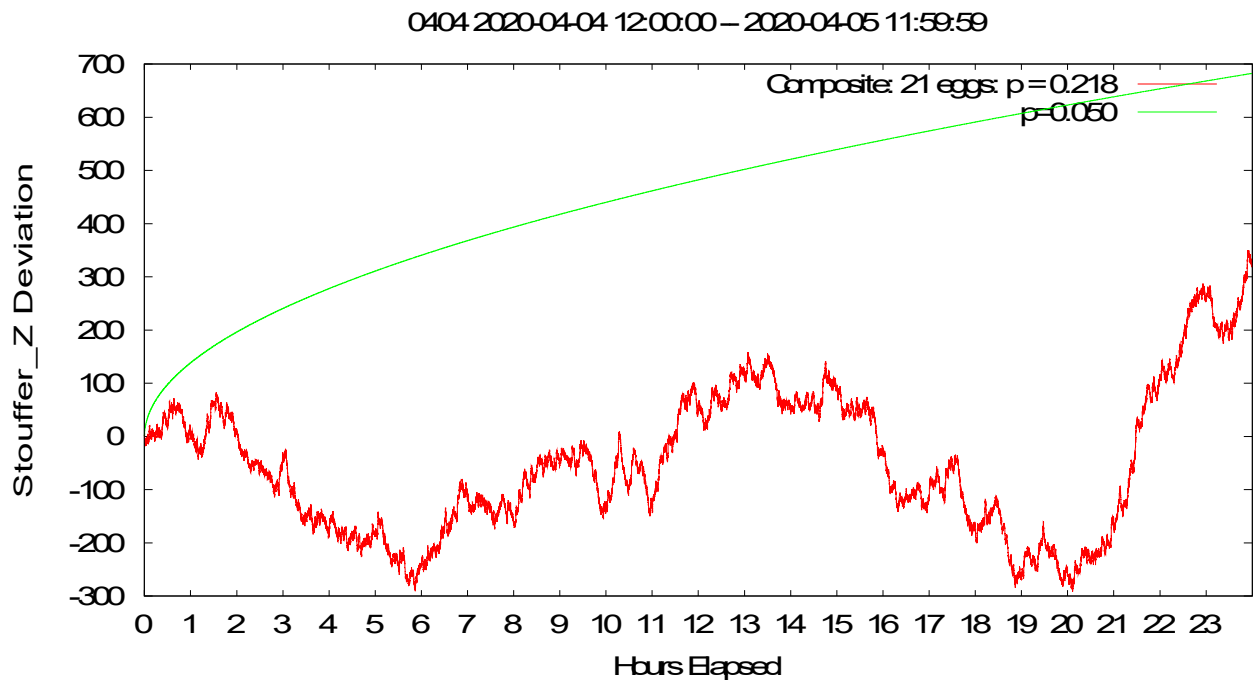

For context the next figure uses the same starting point, but the standard GCP 6 hour event time. It shows the same trend for most of the period.

For those with technical inclination and familiarity with the behavior of random number generators, it may be worth asking whether these two graphs are merely be showing a bias in the data (for unknown reasons). To check on the likelihood that might be the case, I extracted a full 24 hour segment of data, roughly surrounding the time of the global prayer – beginning at noon UTC on the 4th. It is pretty clear the system is not uniformly biased toward negative deviations. There are long positive trends interspersed with long negative trends, with equally strong deviations in either direction.

The next figure shows this larger context, 24 hours starting at noon on the 4th. The time of the prayer is near the middle, at 14:45. We can see why it is appropriate to ask whether the apparent correlation of our data with a designated event is merely a coincidence, or may have more interesting meaning

Report generated 5th April, 2020, by Roger Nelson.
